

Webroot® Web Security Service

No Hardware. No Software. No Malware.

Today's criminals generate over 40,000 new malware samples a day. Webroot® Web Security Service provides better protection by blocking threats before they ever reach your network.

Mobile employees receive the same high level of security they would back at the office. You can easily enforce Internet use policies, track web trends, and detect software vulnerabilities—a unique feature not offered by any other software as a service solution. And with no hardware or software to manage, your IT team saves time and money.

Webroot Web Security Service

KEY BENEFITS

REDUCED TOTAL COST OF OWNERSHIP (TCO)

KEY FEATURES

- No hardware or software to purchase and maintain
- Lower administration overhead
- No switching fees or other upfront costs
- Pay-as-you-go subscription model

PROACTIVE WEB SECURITY

- Stop viruses, phishing, and spyware attacks before they reach your network
- Multiple heuristic filters protect against zero-hour attacks
- Integrated antispyware protection provided by award-winning Webroot Spy Sweeper® technology
- URL filtering and file/content type blocking prevent unwanted content
- Automatic detection of anonymizing proxy sites to prevent circumventing the security service

EASY TO MANAGE

- Intuitive web-based management console
- Set Internet use policies according to group or user level
- Import and configure users through LDAP integration
- Detailed real-time and scheduled reporting
- Support for Citrix and Terminal Services
- Automatic updates of client Desktop Web Proxy (DWP)

RELIABLE SERVICE

- Service Level Agreements (SLAs) ensure uptime and performance
- Fault-tolerant data centers eliminate single point-of-failure risk
- Seamless authentication and protection for mobile laptop users
- Service, security, and support is provided by a global security leader

WHAT'S NEW Vulnerability Scanning and Spyware Detection

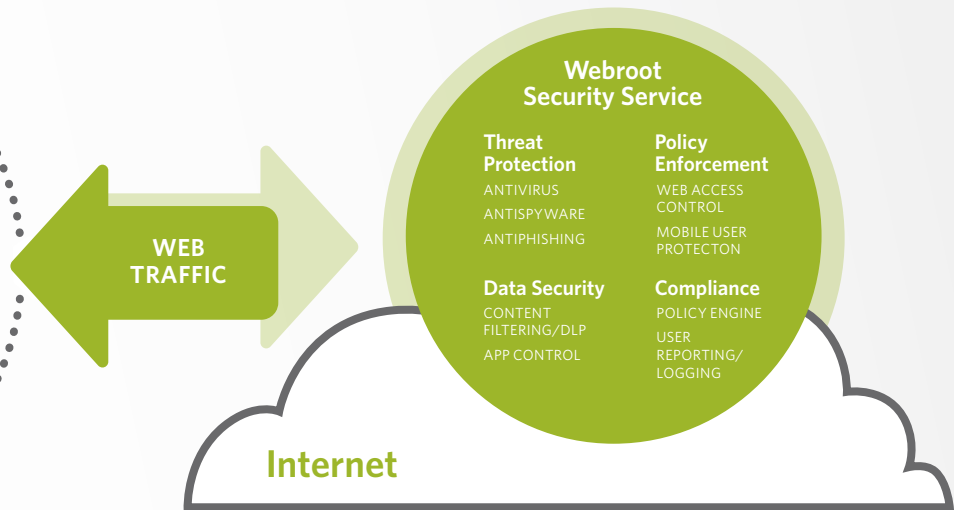

Extra protection only offered by Webroot Web Security Service

- ✓ Find holes in your security before an attacker does
- ✓ Quickly identify software and operating system vulnerabilities
- ✓ Gain visibility into spyware infections
- ✓ Reduce risk without buying and managing a separate vulnerability scanner
- ✓ Prevent data breaches and theft

Customer Environment

Webroot Global Data Center Network

Threat Protection

Antivirus, Antispyware, and Antiphishing

Webroot Web Security Service scans all HTTP and FTP over HTTP requests in the cloud, blocking malware before it ever reaches your network. We guarantee defense against 100% of known malware, and multiple zero-hour heuristic filters protect against new and unknown variants. Antispyware protection is powered by the industry's leading antispyware engine, Webroot Spy Sweeper, which protects millions of desktops worldwide. Antiphishing detection uses advanced heuristics to identify phishing sites in real time, ensuring sensitive personal and corporate data remains secure.

NEW! Vulnerability Scanning and Spyware Detection

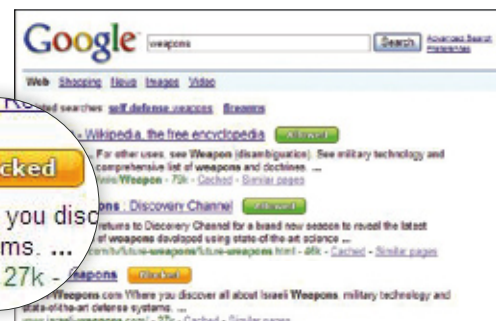

Reduce risk by identifying holes in your security before attackers do. Exclusively offered by Webroot Web Security Service, this powerful feature eliminates the need to purchase and manage a separate vulnerability scanner. You can scan endpoints directly from Webroot's Desktop Web Proxy (DWP) to identify known system vulnerabilities, including operating systems, browser versions, and other installed software, as well as spyware infections. View results within the Management Portal to facilitate remediation.

Proactive Safe Searching Capabilities

Webroot provides a unique "Scan Ahead" technology that examines all search engine queries and returns color-coded search page results based on the requestor's Internet access policy. This feature not only helps enforce Internet use policy, but it also proactively mitigates Internet threats and harmful content. To protect users from exposure to inappropriate content, inappropriate thumbnail images are blocked from search engine results by enforcing the Safe Search feature in search engines.

The Phileas® research system scans the Web for threats

Inform users of web policies and potential threats with color-coded search results

Internet Policy Enforcement

URL and Web Content Filtering

Easily enforce Internet use policies, mitigate data loss, protect users from inappropriate content, and improve productivity. Webroot filters web content based on site URL, web application, attachment type, MIME type, file type, and file size. Millions of URLs are categorized into 12 main categories and 96 subcategories. This database is continuously updated to ensure accurate and advanced control. Content filtering also includes the ability to block advertisements.

Internet Access Control

Set Internet access policies according to group or individual user level, and apply by time and location. Administrators can also set website access to be “Allowed,” “Blocked,” or “Coached” in order to help inform users and manage Internet use. For even greater filtering control, Webroot provides the ability to create customized URL “Allow” and “Deny” lists. Anonymizing proxy detection enforces company Internet use policies even when users attempt to access blocked pages through common or custom anonymizing proxy sites.

Quota Policy Support

Support and enforce Internet use policies by placing limits on bandwidth consumption, time spent online, and number of sites accessed. To help monitor and track Internet use, logs and reports are available to track factors such as daily bandwidth consumed by user and time spent surfing.

Roaming User Protection

Seamlessly enforce company Internet use policies regardless of where an employee is working—whether it’s at home, the airport, a hotel, or an Internet café. Mobile laptop users can be easily configured to receive automatic and uninterrupted protection even while they are outside their organization’s network. Because the Webroot service sits in the cloud, these laptop users can authenticate directly with the service rather than establishing a VPN connection to the corporate network. Included at no additional cost, this roaming user protection helps to improve employee productivity and enhance network security.

Easily block web categories like games or mature content

Gain instant insight into web traffic trends

★★★★★ 5 out of 5 stars

“We successfully transitioned our on-premise solution to the cloud-based Webroot. Performance has been excellent. Most importantly, we enabled the group that monitors Internet usage to get their data directly, **allowing our IT team to focus on other issues.**”

—IT Manager,
Webroot Web Security Customer

Service Management

Simplified Administration

Manage company Internet use and security policies via an intuitive Web-based management console. Administrators can securely access Webroot's powerful rules engine to facilitate user, group, and account level access policies. A real-time Web traffic summary dashboard displays company Web site access by category and popular search terms. The DWP allows for seamless authentication, and can be automatically updated to the latest version.

Real-Time Logging and Reporting

Real-time logs display which sites and downloads users have attempted to access and whether or not they were allowed. With logs accessible for 365 days, administrators can access the historical information they need to generate key metrics. Detailed reports can be run ad-hoc or scheduled, allowing companies to accurately monitor Internet use by viewing graphs on Web traffic trends, top blocked URLs, blocked malware, bandwidth usage, and more. Scheduled reports can be set up to be distributed via email to a user, or a list of users, and can contain up to 100 separate charts for maximum visibility into company and individual Internet use.

Support for Citrix and Terminal Services

Webroot is the only Web Security Service that provides support for Citrix and Terminal Services, a convenient feature that further enhances usability and management. All Citrix or Terminal Services users are individually authenticated. Unique policies can be applied to separate users on a single Citrix or Terminal Services server with user activity logged individually.

Rapid Deployment and Guaranteed Service Availability

Deployment can typically be complete in less than one week and there are no costly hardware, software, or equipment maintenance fees. Webroot also guarantees 99.99% service availability to ensure that you have consistent, reliable access to a secure Web communications environment.

Fast Browsing with Minimal Latency

Maintain a fast browsing experience and ensure a seamless Internet experience for your users. Webroot's distributed architecture minimizes latency by maintaining multi-tenant, fully redundant datacenters around the globe. Global Server Load Balancing (GSLB) automatically routes Web traffic through the nearest datacenter, ensuring rapid response time. Unique Web content download acceleration and proprietary high-performance proxies further improve performance and ensure immediate policy compliance.

View reports on top blocked users, blocked malware, bandwidth usage, and more.

WHY WEBROOT?

Webroot is a global company with a history of delivering innovative security solutions to millions of businesses and consumers. Our best-of-breed technology has won numerous awards and our SaaS solutions protect over three million users worldwide. As one of the largest privately held companies in the Security SaaS market, Webroot has multiple data centers and support offices across the US, Europe, Japan and Australia. To guarantee the highest level of service, all Webroot Security Services are backed by local technical support teams and Service Level Agreements (SLAs) that are among the best in the business.
